

# A290 SQL Programming: Assignment 6

You should turn in a file named `username_a6.sql`. Please adhere to the note about naming your tables.

## **Creating Tables**

Your .sql file should include create table statements for the translation of the ER diagram you did for assignment 5. The statements should be ordered in a way so that no errors because of primary/foreign keys are generated. Create Table statements will be judged based on how well they translate the ER model you completed for Assignment 5, how appropriately data types are selected, and the inclusion of primary/foreign keys.

You should include an explanation in comments for any tables which are not a direct translation of the ER diagram. Explain whether there is a problem with the ER model and what you would change to correct it. Also discuss the data types selected and any assumptions about the data which were made in selecting the data type. If there is a case to be made for a table not having a primary key make that here.

Naming Note:

Every table name should begin with your username.
